RECORDS ROOM

RE:

Dear Ms. Knasko:

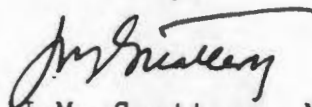

Please forgive me for not having followed through on the clinical reports on . Indeed I did talk to Dr. Evelyn Adams and promised to get those papers out quickly, but I naturally thought I had.

Enclosed are copies of discharge summaries for Mrs. for admissions to the Thompson Hospital in Canandaigua, New York from 1/9/80 through 8/3/82.

In the last years of Mrs. life her major problems were those associated with progressive senility, manifested at times by confusion, irritability, forgetfulness, and so forth. Physically, her major difficulty was associated with recurrent abdominal pain and bouts of diverticulitis. In December, 1979 she had clear clinical evidence of intestinal obstruction and subsequently had a transverse colostomy performed, which subsequently was closed. Her last admission to the hospital was from 4/15/82 through 8/3/82, again having her major initial problem of acute abdomen with peritonitis and perforated diverticulum. Post surgery this lady developed a sequence of complications beginning with a left hemiparesis, acute myocardial infarction and finally intertrochanteric fracture of the right hip. She was then transferred to the Elm Manor Nursing Home where she was followed medically until her demise on 1/24/83, as the result of what was thought to be a cardiac death. At no time during the years that I was Mrs. physician did I see any evidence of carcinoma. This was specifically looked for, especially with her background history.

If I can be of any further service, kindly advise.

Sincerely,

J.M. Guattery, M.D.
